

ABSTRACT OF THE DISCLOSURE

A storage package for multiple recording media includes a plurality of paper board panels arranged end to end and separated from each other by spline strips which allow the panels to be folded upon one another to resemble a closed book. First and second plastic, recording medium-holding latching trays are attached to the inside face of the last panel to be folded and to the panel face opposite the inside face in the folded configuration. Upstanding wall portions on one of the latching trays nest within the corresponding wall portions of the other latching tray when the latching trays are assembled together. Additional trays for holding recording media are attached to panel faces which are in the interior of the package in the closed configuration.
